

NON-FUNCTIONAL REQUIREMENTS

1. Performance

The system should provide acceptable response times for normal user operations, such as viewing, searching, adding, editing, and deleting contacts.

2. Usability

The system should provide a simple, clear, and user-friendly interface so that users can easily manage their contacts.

3. Reliability

The system should ensure that contact information is stored correctly and remains consistent during system operations.

4. Security

The system should require users to authenticate before accessing personal contact management functions.

5. Data Validation

The system should validate required contact information before adding or updating a contact.

The system should prevent invalid or incomplete data from being stored.

6. Data Integrity

The system should maintain the consistency and integrity of user, contact, and system data.

Deleting or updating data should not cause unintended data loss or inconsistency.

7. Availability

The system should be available whenever authorized users need to access its functions, except during maintenance or unexpected system failures.

8. Maintainability

The system should be designed in a modular and well-structured manner to make maintenance and future improvements easier.

9. Compatibility

The system should operate correctly in the supported software environment.
